Energy Saving Tips for the Home

Small, consistent changes around the house often save more energy over a year than one expensive upgrade.

Switching to LED bulbs uses roughly 75 percent less energy than incandescent bulbs and lasts many times longer, which also reduces how often bulbs need replacing.

Sealing drafts around windows and doors keeps heated or cooled air inside, reducing how hard a heating or cooling system has to work to maintain a comfortable temperature.

Unplugging chargers and electronics that are not in use eliminates the small but constant draw known as standby power, which adds up across many devices in a household.
